SwissProt\_40:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PTM: THERE ARE ARE A NUMBER OF REPEATS OF THE TRIPEPTIDE K-S-P, NFH IS PHOSPHORYLATED ON A NUMBER OF THE SERINES IN THIS MOTIF. IT IS THOUGHT THAT PHOSPHORYLATION OF NFH RESULYS IN THE FORMATION OF INTERFILAMENT CROSS BRIDGES THAT ARE IMPORTANT IN THE MAINTENANCE OF AXONAL CALIBER.

PTM: PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF THE LARGER NEUROFILAMENT POLYPEPTIDES (NF-M AND NF-H), THE LEVELS OF PHOSPHORYLATION BEING ALTERED DEVELOPMENTALLY AND COINCIDENT WITH A CHANGE IN THE NEUROFILAMENT PUNCTION. SIMILARITY: BELONGS TO THE INTERMEDIATE PLAMENT FAMILY.

CAUTION: REP. 1 SEQUENCE DIFFERS FROM THAT SHOWN FROM POSITION 783 ONWARD AND IS LONGER DUE TO A FRAMESHIFT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Coiled coil; Neurone; Phosphorylation; Repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Proc. Natl. Acad. Sci. U.S.A. 86:2463-2467(1989).
--I- FUNCTION: NEUROFILAMENTS USUALLY CONTAIN THREE IF PROTEINS: L, M AND H WHICH ARE INVOLVED IN THE MAINTENANCE OF NEURONAL CALIBER.
NF-H HAS AN IMPORTANT FUNCTION IN MAIURE AXONS THAT IS NOT SUBSERVED BY THE TWO SMALLER NF PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                         neurotiliament peptide (NF-H): developmental and tissue expression the rat, and mapping of its human homologue to chromosomes 1 and 22.";

Nat. Genet. 27:201-204(2001).

-!- FUNCTION: DSP may be an important factor in dentinogenesis. DPP may be independent of calcium and facilitate initial mineralization of dentin matrix collagen as well as regulate the size and shape of the crystals.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed in teeth. DPP is synthesized by codontoblast and translently expressed by pre-ameloblasts.
-!- PTM: DSP is glycosylated.
-!- DISEASE: Defects in DSP are the cause of dentinogenesis imperfecta in DSP are the cause of dentinogenesis imperfects in DSP are the cause of dentinogenesis imperfects in DSP and the permanent teeth are affected in which both the primary and the permanent teeth are affected in which both the primary and the permanent teeth are affected in which with an incidence of 1:8000 live births. The teeth are amber and opalescent, the pulp chamber being obliterated by abnormal dentin. The enamel, although unaffected, tends to fracture, which makes dentin undergo rapid attrition, leading to shortening of the

DISBASE: Defects in DSPP are the cause of autosomal dominant
DISBASE: Defects in DSPP are the cause of autosomal dominant
deafiness with dentinogenesis imperfecta 1 syndrome (DFNA39/DGI1
syndrome). Affected individuals present with DGI1 associated with
early onset progressive sensorineural high-frequency hearing loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (POTENTIAL)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMMON factor Nopple."

MAINTERANCE OF THE FUNDAMENTAL STRUCTURE OF THE FIBRILLAR CENTER AND LENGTION RELATED TO NUCLECUCGENESIS, MAY PLAY A ROLE IN THE MAINTERANCE OF THE FUNDAMENTAL STRUCTURE OF THE FIBRILLAR CENTER AND DENSE FIBRILLAR COMPONENT IN THE NUCLECLUGS. IT HAS INTRINSIC GTPASE AND ATPASE ACTIVITIES, MAY PLAY AN IMPORTANT ROLE IN TRANSCRIPTION CAPALYZED BY RNA POLYMERASE I (BY SIMILARIY).

-1. SUBGUIT: Interacts with Dkc1/Nap57, Nop5/Nap65 and fibrillarin.

-1. SUBGLIGLAR LOCATION: SHUTTLES ON CURVILINEAR TRACKS BETWEEN NUCLECLUGAR LOCATION. SHUTTLES ON CURVILINEAR TRACKS BETWEEN NUCLECLUGA AND CYTOPLASM. THESE TRACKS EXTEND FROM THE DENSE FIBRILLAR COMPONENT OF THE NUCLECLUGS ACROSS THE NUCLEOPLASM TO A LIMITED NUMBER OF NUCLEAR PORE COMPLEXES.

-1. PTW: THIS PROTEIN UNDERGOES RAPID AND MASSIVE PHOSPHORYLATION AND DEPHOSPHORYLATION ON CK-II AND PKC SITES. NOPPI40 IS ONE OF THE MOST PHOSPHORYLATED FROTEINS IN THE CELL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              58 PE---PQTPKDSPSKSSAEAQTPEDT--PNKSGAEAKTQKDSSN-KSGAEAKTQKGSTSK 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: DSP may be an important factor in dentinogenesis. DPP may bind high amount of calcium and facilitate initial mineralization of dentin matrix collagen as well as regulate the size and shape of the crystals.

SUBCELLULAR LOCATION: Secreted (By similarity).

TISSUE SPECIFICITY: Expressed in teeth, mainly in odontoblasts and pran: DSP is glycosylated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Dentinogenesis imperfecta 1 with or without progressive hearing loss is associated with distinct mutations in DSPP."; Nat. Genet, 27:201-204(2001).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and for commercia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: SHUTTLES BETWEEN THE NUCLEOLUS AND THE CYTOPLASM. AT TELOPHASE IT BEGINS TO ASSEMBLE INTO GRANULAR-LIKE PRE-NUCLEOLAR BODIES WHICH ARE SUBSEQUENTLY RELOCATED TO NUCLEOLI AT THE EARLY G1-PHASE. ALTENATIVE PRODUCTS: 2 ISOFORMS; ALPHA (SHOWN HERE) AND BETA; ARE PRODUCED BY ALTERNATIVE SPLICING.
                                                                                                                                                                                                                                                                                                                                                                                                        Chen H.-K., Pai C.-Y., Huang J.-Y., Yeh N.-H.;

Chen H.-K., Pai C.-Y., Huang J.-Y., Yeh N.-H.;

"Human Noppl40, which interacts with RNA polymerase I: implications
for TRNA gene transcription and nucleolar structural organization.";

MOI. Cell. Biol. 19:8536-8546(1999)

-1- FUNCTION: RELATED TO NUCLEOLOGENESIS, MAY PLAY A ROLE IN THE
MAINTENNACO OF THE FUNDAMENTAL STRUCTURE OF THE FIBRILLAR CENTER
AND DENSE FIBRILLAR COMPONENT IN THE NUCLEOLUS. IT HAS INTRINSIC
GTPASE AND ATPASE ACTIVITIES. MAY PLAY AN IMPORTANT ROLE IN
TRANSCREPTION CATALIZED BY RNA POLYMERASE I.

-1- SUBUNIT: INTERACTS WITH NA POLYMERASE I 194 KDA SUBUNIT (RPA194)

AND WITH CASEIN KINASE-II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: THIS PROFIEIN UNDERGOES RAPID AND MASSIVE PHOSPHORYLATION AND DEPHOSPHORYLATION ON CK2 AND PKC SITES. THERE IS EVIDENCE SUGGESTING THAT CDC2 KINASE PHOSPHORYLATES P130 AT THE M-PHASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIGNAL (POTENTIAL).
